

# CDW Documentation

**Export to PDF**

---

# Export to PDF

Just use the Export to PDF button on the right (looks like and adobe symbol)

Usage There are three ways to export:

- Export one page
  - You simply need to call the page with an additional `do=export_pdf` URL parameter. This starts the PDF export of the page. Some templates let the plugin extend the pagetools automatically. For other templates you need to implement this yourself to add a button or similar somewhere in your template design.
  - For example is the url is <http://IP/page> you would change it to [http://IP/page&do=export\\_pdf](http://IP/page&do=export_pdf) and it will create and open a download window.
- Export an entire namespace
  - There is the URL parameter `do=export_pdfns` which let you export a chosen entire namespace as one PDF (e.g. use `&do=export_pdfns&book_ns=my:namespace&book_title=Mytitle` (See Configuration options on how to exclude specific pages). Or create a link with the syntax).
- Export selection of pages
  - If you need to select just some pages to export to one PDF, you can use Bookcreator plugin, which offers an interface for the dw2pdf plugin.
